

## **Abstract**

### **Computer-aided diagnosis (CADx) - Perceptual challenges**

#### **Abstract**

Advancement in medical imaging modalities results in huge variety of images engaged in the different management phases, namely prognosis, diagnosis, and treatment. In clinical practice, imaging has reserved a vital role to assist physicians and medical expert for decision-making. However, the counterpart that faces the physician is the complexity to deal with a large amount of data and image contents. Mainly, the interpretation is based on the physician's observations, which is tedious, subject to error, and highly depends on the skills and experience of the clinicians. Accordingly, an emerging demand for automated tools become essential for detecting, quantifying and classifying the disease for accurate diagnosis.

Computer-Aided Diagnosis (CADx) is an emergent research area that aims to meet the physicians' demands, to speed up the diagnostic process, to reduce diagnostic errors, and to improve the quantitative evaluation. It is based mainly on medical images that provide direct visualization of the bodies and information ranging from functional activities, anatomical information, to the cellular and molecular expressions. Recently, varieties of Computer-Aided Detection (CADE) and diagnosis (CADx) procedures have been established to assist the automated interpretation of the medical images to attain an accurate and reliable diagnosis. Several CADE and CADx approaches can be categorized according to their uses into i) type I for qualitative analysis and visual detection of the objects under concern in the medical images by enhancing the salient features of the objects or suppressing the background noises, ii) type II for assisting objects' extraction for further quantitative analyses for boundary delineation, tree-structure reconstruction, and fiber tracking, iii) type III for automatically detect and classify the objects using signal processing, medical image analysis and technologies, iv) type VI for estimating the functional and anatomical tissue properties based on mathematical modeling, where such properties are not obviously clear in the medical images, for example, physiology, heat transfer, biomechanics, and so forth.

**This talk provides** a state-of-the-art sight in medical imaging applied to CADx. It highlights the different imaging modalities, such as magnetic resonance imaging (MRI), Computed Tomography (CT), Positron Emission Tomography (PET), and ultrasound. **The talk clarifies** the relation between the physicians and the automated CAD systems. The talk emphasizes on the CAD ability to improve the diagnostic accuracy with future perspectives of perceptual challenges to

applications of CAD. A comparison between the computer-aided detection (CADE) and the computer-aided diagnosis (CADx) is also conducted. **This talk exhibits** the different future directions as an opening that gathers the clinicians and engineers for accurate diagnosis.

## Keynote Speaker

**Nilanjan Dey** received his Ph. D. Degree from Jadavpur University, India. He is a faculty in the Department of Information Technology, Techno India College of Technology, Kolkata, W.B., India. He holds an honorary position of Visiting Scientist at Global Biomedical Technologies Inc., CA, USA and

Research Scientist of Laboratory of Applied Mathematical Modeling in Human Physiology, Territorial Organization of- Scientific and Engineering Unions, Bulgaria. Associate Researcher of Laboratoire RIADI, University of Manouba, Tunisia. He is scientific Member of Centro de Estudos Organizacionais e Sociais do Politécnico do Porto (CEOS.PP), Portugal.

He is the Editor-in-Chief of International Journal of Ambient Computing and Intelligence (IGI Global), US, International Journal of Rough Sets and Data Analysis (IGI Global), US, the International Journal of Synthetic Emotions (IGI Global), US, (Co-EinC) and International Journal of Natural Computing Research (IGI Global), US.

Series Editor (Co.) of Advances in Ubiquitous Sensing Applications for Healthcare (AUSAH), Elsevier, Advances in Geospatial Technologies (AGT) Book Series, (IGI Global), US, Associated Editor of IEEE Access and International Journal of Information Technology, Springer.

His research topic is Medical Imaging, Data mining, Machine learning, Computer Aided Diagnosis, Atherosclerosis etc. He has 20 books and more than 200 research articles in peer-reviewed journals and international conferences. He is the organizing committee member of several international conferences including ITITS, W4C, ICMIR, ICICT etc.
